## Chapter One

He was 64 years old. He was born in Mexico City and considered one of the world's leading experts on Aztec civilization. He was a curator of the National Museum and he was selected to give newly-elected US President Barack Obama a tour on his first state visit to Mexico on Friday, April 16th, 2009.

His hands gestured in a lively way; his shoes hammered on the polished floor. Surrounded by officials, he accompanied Obama as well as Felipe Calderon, the Mexican President, into Room 7, the Mexico Hall or Sala Mexica, where the most famous of all the Aztec treasures is kept.

The Sun Stone, illuminated by a few soft lamps, emerged out of the darkness. Weighing 25 tonnes and 12 feet in diameter, the intricately carved basalt stone illustrating aspects of Aztec cosmology is mounted on a monolithic slab.

Pointing upwards, the archaeologist Felipe Solis explained the Aztec concept of time as a medium or raw material that allows a certain thing to grow organically, and evolve and develop to its fullest extent, similar to the way a flower or tree needs a certain period of time to grow in stages out of seeds, and, most importantly, what the significance of December 21st, 2012 when the earth moves into a rare alignment with the Galactic centre, might be.

Would it be the start of a new era? Or the end?

Shortly afterwards, he felt a severe pain in his throat and chest. He thought it was just the flu, and continued working on his current project.

He was preparing for an exhibition to be launched the following month called: „Teotihuacan, City of Gods“. He wanted to convey all his awe at what the Aztecs had accomplished, and demonstrate the full glory of their empire, destroyed by Spanish invaders, in a ground-breaking display with plenty of background information on the ideological and political dimensions of the ceremonial sites where ritual human sacrifices took place.

The following morning, he got up and told his family he found it hard to breathe and swallow. Fire burned in his chest. His condition deteriorated

fast: that same day, Saturday, he went to hospital, and was put into an intensive care unit. His doctors diagnosed viral pneumonia, aggravated by diabetes. He lapsed into a coma, recovered briefly, but lost consciousness again.

On Thursday, 23 April, at 7 am in the morning, Felipe Solis was declared dead: the clinical cause of his death was given as a heart attack, according to a report in *El Notre* with the headline: „Serves Obama and dies 7 days later; “Atiende a Obama y muere a los 7 días.

By this time, Mexico was in a state of high alert over an outbreak of swine flu that coincided with the visit of Obama.

Outside the hospital where Solis lay in intensive care, soldiers were distributing face masks in the streets as hysteria gripped the capital city.

Mexico City was placed under quarantine for five days. For five days, 20 million people were forced to stay at home, turning the world’s second largest city into a ghost town. Soldiers with weapons and wearing face masks patrolled the streets. Shops, schools and universities were closed; demonstrations were banned.

These drastic measures were taken even though the World Health Organization (WHO), the United Nation’s global health watchdog, had confirmed only 9 deaths from the swine flu in Mexico by this time. On Wednesday 29 April 2009, WHO reported cases of the swine flu in 9 countries.

Although the first victim of the swine flu was later reported to be a census worker called Maria Adela Gutierrez who died on April 13<sup>th</sup>, it was Felipe Solis’s death that was first telegraphed around the world.

On Saturday, April 25<sup>th</sup>, Bloomberg reported Solis had died the very day after meeting Obama, intertwining the origin and trajectory of the swine flu pandemic with the person and movements of the US president from the very beginning.

„Obama was received at Mexico’s anthropology museum in Mexico City by Felipe Solis, a distinguished archeologist who died the following day from symptoms similar to flu, *Reforma* newspaper reported. The newspaper didn’t confirm if Solis had swine flu or not,“ wrote Thomas Black.

In fact, without the presence of the international press corps

accompanying Obama on his visit to Mexico, the news of the swine flu would not have reached such a large audience so quickly.

The swine flu was nowhere on the media radar screen when Obama and Calderon held a joint press conference on April 16th.

Just days later, the swine flu exploded onto the global media stage, dominating cable TV screens, newspaper headlines and internet news sites. The mainstream media presented the swine flu as threat on a different scale from all other diseases, as a killer virus that had emerged out of nowhere to become a threat the entire globe within the period of a few days, and the mainstream media has played a key role in shaping the perceptions and attitude towards the swine flu virus ever since.

A five-year-old boy in La Gloria, a remote village of 3000 people in the hills of the Sierra Madre, where farmers still use horse drawn carts to get around, was declared by the government to have tested positive for the swine flu or A/H1N1 virus when a sample was sent to labs in the US and Canada. The government said Edgar Hernández, who recovered rapidly, had had the illness earlier that month and was probably the origin of the swine flu outbreak.

But while Edgar Hernández tested positive for the swine flu, he was the only villager to have done so.

In addition, is not clear how one small boy living in a remote village where foot, bicycle and horse are the mode of transport of many people could have spread the swine flu to so many people in so short a period of time that the entire country of Mexico – indeed the entire world – was potentially threatened.

The mother of the boy, Maria del Carmen Hernández, added to the mystery.

“I don’t know where the virus came from, and I don’t think anyone else does, either,” she said, according to a report in the FT on May 1 2009.

It was reported, the virus had originated in a nearby pig farm. But officials inspecting the pigs in the factory belonging to the company Granjas Carroll de Mexico, which is 50 per cent-owned by the US company Smithfield, found that none of the animals were infected by the swine flu virus.

Yet, according to the narrative of WHO and the mainstream media, the swine flu virus spread from this remote the pig farm and La Gloria to the USA, Europe and the rest of the world in the space of a few days.

On April 29<sup>th</sup> already, the first death in the USA from swine flu was reported. A 23-month-old child in Texas was diagnosed as having died from the swine flu by Dr. Richard Besser, acting director of the Centers for Disease Control and Prevention (CDC), the US partner of WHO.

By this time, the number of confirmed swine flu cases in the United States was reported to be 66 in 6 states, with 45 in New York, 11 in California, six in Texas, two in Kansas and one in Indiana and Ohio. New York city's health commissioner said hundreds of schoolchildren were ill at a school and some students had been confirmed to have the swine flu.

Press frenzy reached a fever pitch: pandemic victims were mentioned on the nightly news all around the globe.

„Death flies through the air,“ („Der Tod fliegt durch die Luft“) was a typical the headline in Germany's newspaper Die Sueddeutsche Zeitung on April 27th.

About 6 weeks later, on 11th June, WHO reported cases in 74 countries. By 1st July, infections had been confirmed by WHO in 120 countries.

But while the swine flu might have spread rapidly, it killed few people.

By July 7<sup>th</sup> only 429 people had died from the swine flu according to WHO's own figures. This is a fraction of the 36,000 people who are estimated to die from the flu in the USA every year by the CDC.

In fact, it would not be going too far to say that the swine flu pandemic is a media event in as far as there have been almost no deaths, and yet the networks have saturated the airwaves with reports, video footage, and images suggesting the people of the world are in imminent danger.

Footage of people wearing face masks in Mexico City, and people waiting in hospital corridors for specific medical therapies have given a degree of visual support to the claim the world was in the grip of a swine flu pandemic when the facts showed there was no pandemic.

The media has shaped and framed a fictional narrative to its liking,

detached from the objective reality, presenting the story of a virus easily transmissible, raging through Mexico, and killing masses of people. The sheer quantity of video clips, and images of alleged pandemic victims, pig farms, people wearing face masks, sick children on respirators has actually helped concealed the objective fact that the swine flu had killed very few people by July, only about 400 people according to the WHO's own figures.

The true aim of the media coverage is not, however, to give factual information about the nature of the swine flu virus to the audience. The goal of the media coverage is to instill fear in the audience watching at home, and drive them to rush out and get the swine flu vaccine.

From the same moment the swine flu virus burst onto the global media stage at the end of April as a villain, the swine flu vaccine has made an appearance, presented as a hero, and a saviour, in spite of the fact the swine flu pandemic vaccine has not been adequately tested and contains mercury as well as the adjuvant, squalene, known to cause autoimmune and other diseases.

In April, WHO immediately issued instructions to the CDC and pharmaceutical companies to start preparing to develop a swine flu vaccine.

Shares of the five major vaccine manufacturers companies Baxter, Novartis, GlaxoSmithKline and Sanofi and CSL soared on the expectation that they would earn billions.

Plans were put into place from 2005 to vaccinate billions of people around the world in the event of a pandemic emergency being declared. The swine flu pandemic emergency triggered contracts that national governments had sealed with pharmaceutical companies in 2005 to supply billions of dollars worth of pandemic vaccines.

In spring 2009, governments around the world began to activate existing contracts to buy pandemic vaccines from four major pharmaceutical companies – Baxter, Novartis, GlaxoSmithKline and Sanofi Pasteur.

The US government sealed contracts with CSL Limited, Novartis, Sanofi Pasteur, GlaxoSmithKline, and MedImmune to produce the swine flu vaccine. All five of these companies also produced vaccines for bird flu or SARS.

France bought 94 million individual vaccinations from Baxter, Sanofi, GlaxoSmithKline, and Novartis at a cost of 869 million euros while Canada

placed an order for 50.4 million doses from GlaxoSmithKline at a cost of \$400 million to give just two examples.

Vaccine manufacturers were guaranteed they would be shielded from any lawsuits in the event that their vaccines caused death or damage.

Almost the same day of the swine flu outbreak, on April 24<sup>th</sup>, WHO ordered its Pandemic Control Room, which is designed to track the spread of a pandemic virus around the globe and equipped with supercomputers tied to UN member states security forces, to be manned 24 hours for the first time as a prelude to declaring a pandemic level 6 emergency, the highest alert level on the planet.

Dire predictions a bird flu pandemic that could cause the deaths of millions of people worldwide as well as the collapse of economic and social infrastructure have been made in recent years, and magnified by coverage in the mainstream media in spite of the fact that there is no scientific basis for these predictions.

In fact, the closest the world has ever come to a bird flu pandemic was in February 2009, just weeks before the Mexico swine flu pandemic outbreak, when the pharmaceutical company Baxter --- headquartered close to Chicago in Deerfield, Illinois where Obama has his senate seat -- contaminated 72 kilos of seasonal flu vaccine material with the live bird flu virus in its facilities in Orth an der Donau, and then proceeded to distribute this material via a company called Avir Avir Green Hills Biotechnology in Vienna to 16 labs in Austria, Slovenia, Czech Republic and Germany.

A WHO reference laboratory supplied the bird flu virus to Baxter that ended up contaminating the vaccine material, according to Baxter's spokesperson.

It is not clear why Baxter had the bird flu virus in its facilities in the first place. The bird flu virus is considered to be one of the most deadly viruses known to humankind with a 60 % mortality rate, and was bioengineered in US weapons labs from the Spanish flu virus, according to a report from October 2005 in Der Spiegel.

Baxter itself has said that the contamination of the 72 kilos of vaccine material in Orth an der Donau was an accident. However, the company has

not given any account of what sequence of actions were performed inside its facilities that could have resulted in such an accidental contamination.

Because Baxter is obliged to use biosafety level 3 regulations when experimenting on bird flu virus, an accidental contamination can be virtually ruled out. The standards for protecting a virus classified as among the most dangerous bioweapons in the world are very different from those for work on a material that is not considered dangerous in a standard lab, and include double doors, airlocks and special protection clothing and so on.

The contamination was only discovered after a technician at the Czech lab BioTest injected the Baxter material into ferrets, who became sick and had to be destroyed. Biotest raised the alarm with the authorities and emergency pandemic control measures began to be implemented on Friday February 6th.

As a result, 35 lab staff in Austria and the Czech Republic who had come into contact with the contaminated material had to be treated preventatively for the bird flu in hospital underlining the danger that this material -- which was destined for use in vaccines -- posed to people who came in contact with it.

The Times of India reported Baxter had almost triggered a global bird flu pandemic.

„Virus mix-up by lab could have resulted in pandemic,“ was the headline of a report from March 6th, 2009.

The Baxter contamination incident strongly suggests the notion that pharmaceutical companies are actively engaged in attempting to trigger the very pandemics that they stand to profit from.

The police opened an investigation after I filed charges but the investigation was dropped in September 2009 shortly before Baxter applied for its final marketing approval for its swine flu vaccine, Celvapan, although it is not clear what the basis of the decision to drop charges was.

Baxter itself has said that the contamination of the material was an accident. However, the company has not explained exactly what sequence of actions were performed inside its biosecurity lab that could have resulted in such an accidental contamination of 72 kilos of seasonal flu vaccine material.

As early as 1994, Laurie Garrett, Senior Fellow for Global Health

at the Council on Foreign Relations authored a book called „The Coming Plague”, starting the pandemic scare mongering. Garrett also was among the first advocates for establishing a global pandemic response system centred around the WHO.

In June 1996, the U.S. Air Force published „Air Force 2025, “presenting the case of an influence pandemic emerging in 2009 as a possible „future scenarios“ in a conflict setting.

In 2003, Garrett’s rhetoric magnified the threat of the emergence of a virus „capable of infecting 40 percent of the world’s human population and killing unimaginable numbers,” and warned „doom may loom.”

“The havoc such a disease could wreak is commonly compared to the devastation of the 1918-19 Spanish flu, which killed 50 million people in 18 months. But avian flu is far more dangerous.. ...humanity could well face a pandemic unlike any ever witnessed,” Garrett wrote in a 2003 report called “The Next Pandemic” for the Council of Foreign Relations.

In 2005, UN official David Nabarro said that flu pandemic could kill between 5-150 million people, and warned that a pandemic disaster could strike at any time.

The World Bank estimated in 2008, a flu pandemic could kill 71 million people around the world. and push the global economy into a „major global recession“, costing more than \$3 trillion.

Governments joined in the scare mongering.

Former US Secretary of Homeland Security Michael Chertoff predicted in an essay published in the Joint Force Quarterly Issue 51, in 2008, a „severe pandemic influenza may affect the lives of millions of Americans, cause significant numbers of illnesses and fatalities, and substantially disrupt our economic and social stability.”

In 2005, WHO had expanded existing regulations for handling infectious diseases -- the International Health Regulations -- to create a single, unifying strategic concept of how to manage the consequences of a pandemic on a worldwide scale that involved synchronizing the actions taken by all governments and pharmaceutical companies with those of WHO.

The focus of this strategy was a mass vaccination campaign.

On July 7th, WHO's Strategic Advisory Group of Experts (SAGE) on Immunization held a meeting in Geneva to discuss the swine flu pandemic and recommended the implementation of a worldwide vaccination programme with new and largely untested pandemic vaccines that were to be allowed onto the market under the pretext of a pandemic emergency. A few days later, on July 11<sup>th</sup>, WHO's Director General Dr Margaret Chan endorsed the recommendations of SAGE, launching the world's biggest ever mass vaccination campaign using new live attenuated influenza vaccines to be administered in two doses and formulated with oil-in-water adjuvants as well as thiomersal or mercury.

Health workers, fire fighters, the police, followed by babies, children and pregnant women were designated as the priority groups when the swine flu jab campaign started autumn 2009 even though there is no clinical data on the impact of the new pandemic vaccines on pregnant women and children.

Under special pandemic emergency regulations, vaccine companies did not have to provide any data proving that their vaccines were safe or efficacious. The fast-track testing process reduced some clinical trials, limited mainly to health adults, to as little as 5 days.

But by January 2010, the ambitious mass vaccination programme for a 100% vaccination of populations lay in tatters, and investigations had begun.

The mainstream media and WHO had communicated an objectively false content about the danger of the swine flu pandemic and also about the swine flu vaccines. The dangers of the swine flu virus were systematically exaggerated; the vaccine, on the other hand, was presented as safe, tested and effective when there was inadequate clinical data to support these claims.

False statements were made about the usefulness of the vaccine for children and pregnant women that have no basis in clinical trials results.

It was the internet that allowed the information about the swine flu vaccine to circulate unfiltered among people. The facts about the swine flu vaccine were spread through email youtube, videosharing, twitter, and independent news sites. Bloggers have kept issues such as the danger of the antiviral drug Tamiflu as well as of the vaccine adjuvant, squalene, which contributed to the Gulf War Syndrome among US and UK vets, in the public

eye when this information has been suppressed by the mainstream media, pharmaceutical companies as well as WHO and governments.

Reports that hundreds of people in Sweden -- the first country in Europe to implement the mass swine flu vaccination programme -- had become sick or died soon after getting the jab; that the German army doctors had issued a recommendation against the swine flu vaccine; and that the Polish Health Minister, Ewa Kopacz, a family doctor, had refused to buy the swine flu vaccines because they were not adequately tested circulated among the people of the world on the internet.

The objective facts about the dangers of the swine flu jab were also presented by sections of the mainstream media, for example, in interviews with doctors eroded support for the swine flu vaccination.

As a result, only 6 to 7 % of the people in Europe took the jab in spite of the unprecedented campaign of scaremongering by the government and media over the swine flu threat.

WHO's Dr Margaret Chan herself admitted that the organization had not anticipated people would refuse the vaccine in an address to the Executive Board on January 18<sup>th</sup>. She attributed the mass refusal to the growth of the new communication and information technologies, which had indeed allowed people access to facts about the swine flu vaccine suppressed by WHO.

The internet has proved to be a powerful, even revolutionary tool, gathering support for a critical investigation into the swine flu "scam."

On January 26<sup>th</sup>, the Council of Europe Parliamentary Assembly held a public hearing into whether WHO had exaggerated the threat of the swine flu in order to allow pharmaceutical companies to reap gigantic profits.

Crucially, the Council of Europe also appointed Paul Flynn to prepare a report on the fake swine flu pandemic for the Parliamentary Assembly.

**FALSE** PANDEMIC
